

13 Adjacent Properties (Item 17)

There are no immediately adjacent properties that contain uranium mineralization or uranium deposit and there are no uranium operating mines near the Centennial Project.

The nearest uranium deposit for which uranium is or has been produced by ISR method are the mines in the Powder River Basin of Wyoming, approximately 100mi to the northwest, and those deposits are hosted in different age and stratigraphic sandstone units.

There are no nearby or adjacent uranium properties that have bearing on the merits of the Centennial Project.
