Here is a copy of the Division initiated modification to the Powertech Uranium Certification for Discharges Associated with Subterranean Dewatering and Well Development. The certification has been modified to replace the report requirement with a numeric limitation for Radium 226 and 228. The certification also includes a new description of the project, a summary of the sampling analysis submitted with the application compared to the water quality standard, a limit for flow, and a requirement for the discharge water to be retained and stored on site until analysis can be completed and results demonstrate compliance with the limits outlined in the certification.

Thank you,  
Maura
